Permalinks in the EBSCOhost Database

When citing a source from a database in MLA 8\textsuperscript{th} Edition, the work cited entry for that source will end with the online location of the source. DOIs are preferred for listing this location, but not all articles are assigned a DOI.

When there is no DOI available, a permalink should be used if one is available. Instead of using the URL from the address bar in a browser, EBSCOhost databases offer something called a permalink. The permalink is a link that is less likely to change and often shorter than the URL from the address bar.

When looking for the permalink (the stable link) within an EBSCOhost database, click the button on the right navigation menu for permalink. When clicked, the permalink link will pop up on the screen. Refer to the screenshot below to see an example of a page where the permalink has been selected.
